## COM Design and Analysis of Algorithms Assignment-1

Note: All assignments involve a team of size 5 or 6 . Due: $18 / \mathrm{Jan}$

1. Given an integer array, write an algorithm to find max and min. Calculate its step count. Express the step count (time complexity) interms of $O, \Omega, \theta, o, \omega$.
2. Write a recursive algorithm to search an element in an integer array. Calculate its step count. Express the step count (time complexity) interms of $O, \Omega, \theta, o, \omega$.
3. Algorithm $A$ performs $10 n^{2}$ basic operations, and algorithm $B$ performs $300 \log n$ basic operations. For what value of $n$ does algorithm $B$ start to show its better performance.
4. In each of the following situations, indicate whether $f=O(g)$ or $f=\Omega(g)$ or both (in which case $f=\theta(g)$

|  | $f(n)$ |
| :--- | :---: |
| (a) $\mathrm{n}-100$ | $g(n)$ |
| (b) $100 \mathrm{n}+\log \mathrm{n}$ | $\mathrm{n}-200$ |
| (c) $\log 2 \mathrm{n}$ | $\mathrm{n}+(\log n)^{2}$ |
| (d) $n^{1.01}$ | $\log 3 \mathrm{n}$ |
| (e) $n 2^{n}$ | $n \log ^{2} n$ |
| (f) $n!$ | $3^{n}$ |

5. Arrange the following functions in order. $7, \frac{1}{n^{2}}, 2^{n \cdot \log n}, 4^{\log n}, n^{\log 7}, n!,\left(\frac{n}{e}\right)^{n}$
6. For each of the above function, express the function (time complexity) using little-oh and little-omega.
7. Fill-in the following table with a tick if the asymptotic notation satisfies the property. Justify any three.

| Notation | Reflectivity | Symmetric | Transitive | Antisymmetric |
| :--- | :--- | :--- | :--- | :--- |
| $\theta$ |  |  |  |  |
| $O$ |  |  |  |  |
| $\Omega$ |  |  |  |  |
| $o$ |  |  |  |  |
| $\omega$ |  |  |  |  |
